Abstract

This memo presents the power loss estimation in the Electrostatic Separators of the ILC alternative head-on scheme at 500 GeV in the center-of-mass, for the Nominal and High Luminosity beam parameters set, induced both by beam particles and radiative Bhabha processes.

Computation

The computation of the power losses has been realized using DIMAD software in the alternative head-on scheme [1] extraction line. In order to achieve an accurate estimation of the power losses, high statistics macro-particle distributions [2,3] have been tracked. Table 1 shows the number of macro-particles (resp. particles) tracked for the beam (resp. radiative Bhabha processes). With these beam statistics the upper limit of the minimal power deposition which can be obtained is 1.8 W (corresponding power deposition from one charged beam macro-particle at 250 GeV). For Nominal (resp. High Luminosity) beam parameters, the total radiative Bhabha processes is about 72 W (resp. 147 W). The minimal power deposition is much lower in this case, around 0.07 W (resp. 0.03 W).

		Number of macro-particles or particles
Nominal	Beam	6 183 275 (macro-particles)
	Radiative Bhabha processes	5 286 120 (particles)
High Luminosity	Beam	5 983 849 (macro-particles)
	Radiative Bhabha processes	11 188 544 (particles)

Table 1 : Statistics used in the computation [2,3].

The results are shown in Table 2 and Table 3 for the 7 Electrostatics Separators (ES) needed in the present design, both for full and vertically split electrodes. The full horizontal gap between electrodes of each ES device is 100 mm, and their total vertical extent is 50 mm (theses dimensions are used in DIMAD software to define the transverse aperture of each ES device). In the case of calculation with splits electrodes, an additional vertical gap of up to 50 mm is introduced in the middle of each electrode.

Results for full electrode

		ES1*	ES2	ES3	ES4	ES5	ES6	ES7	Total ES
Nominal	Charged particles	≤ 1.8	≤ 1.8	≤ 1.8	≤ 1.8	≤ 1.8	4 ± 3	8 ± 3	$\leq 21 \pm 6$
	Radiative Bhabha processes	10^{-3}	$(52 \pm 1) \cdot 10^{-3}$	$(112 \pm 1) \cdot 10^{-3}$	$(150 \pm 2) \cdot 10^{-3}$	$(180 \pm 1) \cdot 10^{-3}$	$(203 \pm 2) \cdot 10^{-3}$	$(219 \pm 2) \cdot 10^{-3}$	0.92 ± 0.01
High Luminosity	Charged particles	≤ 1.8	3 ± 2	27 ± 4	207 ± 12	811 ± 25	2061 ± 42	3474 ± 56	6583 ± 143
	Radiative Bhabha processes	$(2 \pm 1) \cdot 10^{-3}$	$(94 \pm 1) \cdot 10^{-3}$	$(208 \pm 2) \cdot 10^{-3}$	$(301 \pm 2) \cdot 10^{-3}$	$(392 \pm 3) \cdot 10^{-3}$	$(480 \pm 3) \cdot 10^{-3}$	$(559 \pm 4) \cdot 10^{-3}$	2.04 ± 0.02

Table 2 : Power losses (in W) in the 7 ES devices, for full electrodes.

Results for 50 mm full gap split electrode

		ES1	ES2	ES3	ES4	ES5	ES6	ES7	Total ES
Nominal	Charged particles	≤ 1.8	≤ 1.8	≤ 1.8	≤ 1.8	≤ 1.8	≤ 1.8	≤ 1.8	≤ 13
	Radiative Bhabha processes	10^{-3}	$2 \cdot 10^{-3}$	$3 \cdot 10^{-3}$	$3 \cdot 10^{-3}$	$3 \cdot 10^{-3}$	$4 \cdot 10^{-3}$	$4 \cdot 10^{-3}$	0.02
High Luminosity	Charged particles	≤ 1.8	2	4	6	23	26	36	≤ 99
	Radiative Bhabha processes	$2 \cdot 10^{-3}$	$7 \cdot 10^{-3}$	$9 \cdot 10^{-3}$	$9 \cdot 10^{-3}$	$11 \cdot 10^{-3}$	$12 \cdot 10^{-3}$	$12 \cdot 10^{-3}$	0.063

Table 3 : Power losses (in W) in the 7 ES devices, for electrodes split in the vertical plane for 50 mm full vertical gap.

* The entrance (view from the IP) of the first ES device is located at 11.318 m to the IP.

Results for different split electrodes

The power losses in the 7 ES devices have been computed for different sizes of the vertical gap in the electrodes (vertical gap = 10, 20, 30, 40, 50 mm). Figure 1 shows the power losses for each ES device as a function of the full vertical gap.

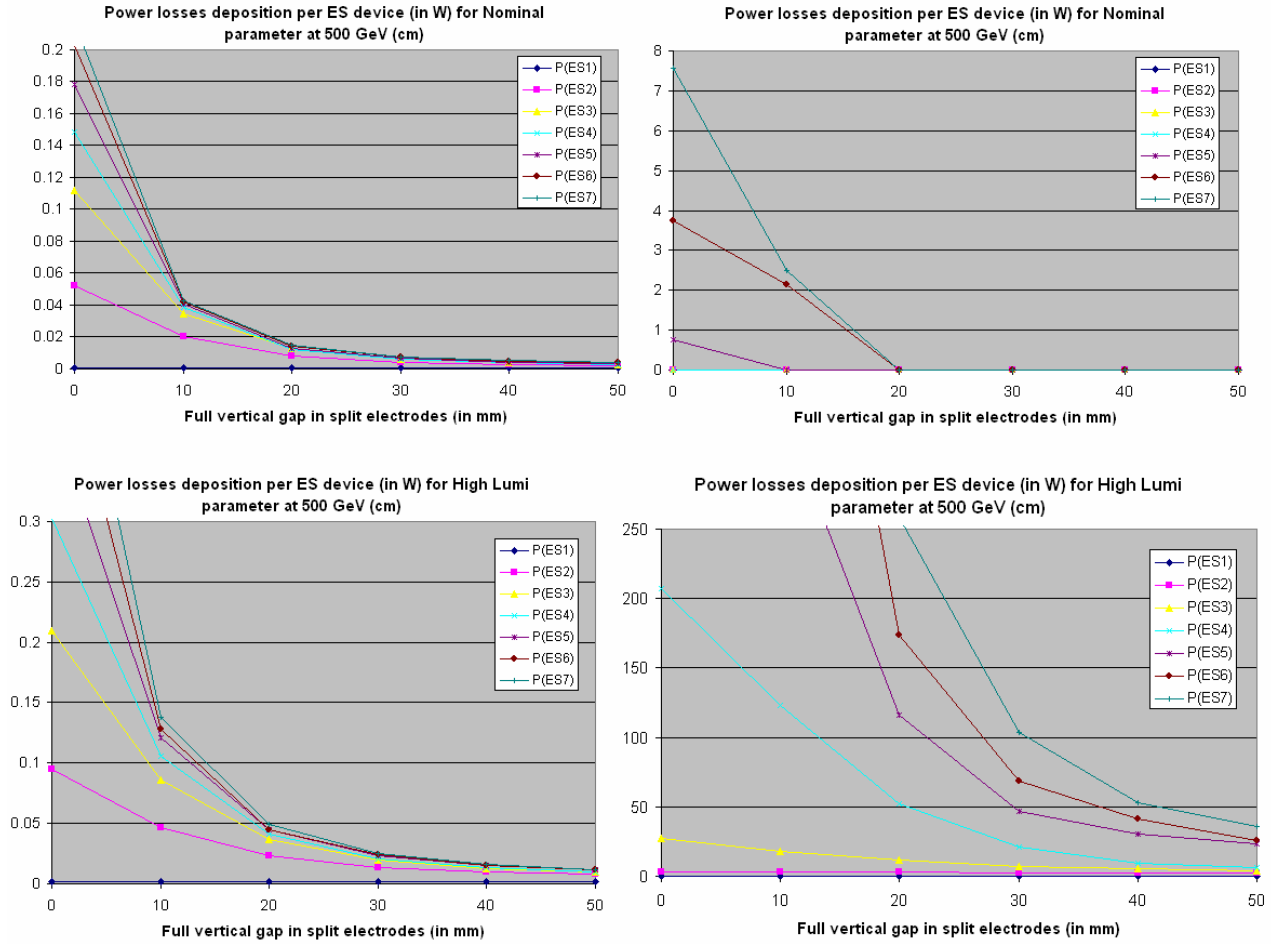

Figure 1 : Power losses for each 7 ES device for Nominal parameters (upper panel) and High Luminosity (lower panel) set at 500 GeV in the center-of-mass, induced by radiative Bhabha processes (left panel) and beam particles (right panel).

Conclusions

In both Nominal and High Luminosity beam parameter sets, the power losses in the seven ES devices of the ILC alternative head-on scheme induced by the beam particles is always more than one order of magnitude greater than the power losses induced by the radiative Bhabha processes.

The level of the power losses induced by beam charge particles in the four last ES devices (3.5 kW for the very last one) shows that a full electrode design would not be realistic for High Luminosity beam parameters. Vertically split electrodes would most certainly be required in these cases.

An important question which remains to be investigated is whether losses up to 36 W distributed on the two Titanium split electrodes which are planned [1] are acceptable. Presumably, suitable collimators can be introduced between each of the 7 ES devices for protection.

Besides the beam distribution and the radiative Bhabha process, other sources from the beamstrahlung cone and from incoherent pairs are negligible in the ES.
